RESEARCH INTERESTS

As an evolutionary biologist in the emerging field of geo-genomics, I study how species evolve in response to physical changes in the landscape over time. To do this I integrate population genetics and genomics with paleoclimatology, sea-level change, and earth surface and coastal processes to study this coevolution in a statistically explicit framework. My motivating questions are on the co-evolutionary nature of Earth and life; they are often explicit in space and time and include:

- How do tectono-sedimentary processes and sea-level change exert top-down control in driving population structure and diversification of coastal marine species over recent and deep time?
- How can we use geo-climatic data to statistically determine the relative contributions of adaptive versus neutral genomic divergence in driving speciation?
- What can population genetic theory tell us about the origins of life on Earth and rise of organismal and genomic complexity?
- How can we disentangle the signatures of multiple psuedocongruent, co-occurring tectonic and climatic processes in forcing genomic and organismal evolution?
