RESEARCH INTERESTS

I study how geological processes shape the formation of biodiversity. I use quantitative models to integrate how paleo-landscapes change over time along with genomic signatures that record how populations evolved with those landscapes. This marries both empirical and theoretical approaches.

Motivating questions

- *Which geo-climatic processes most generate biodiversity over recent and deep time?*
- *How do organisms vary in their response to shared geo-climatic forces?*
- *How can we apply new tools (e.g., information and causal theory) to formalize and quantify landscape change, genomic divergence, and the relationship between the two?*
